

Remote Patient Monitoring for Hypertension

A Smarter Approach to Blood Pressure Management

Hypertension is a leading risk factor for heart disease, stroke, and kidney failure, yet nearly **half of adults with high blood pressure don't have it under control**. Traditional care models rely on periodic office visits, leading to gaps in treatment.

VeeOne Health's Remote Patient Monitoring (RPM) solution bridges this gap with real-time tracking, proactive interventions, and improved patient engagement.

How VeeOne's RPM Works

Cellular-Connected Blood Pressure Monitors - No Wi-Fi needed; readings transmit automatically.

AI-Driven Alerts & Trends - Detects patterns and flags concerns early.

24/7 Nurse-Led Monitoring - Real-time engagement and intervention for better outcomes.

Actionable Insights for Providers - Helps optimize care plans with data-driven decisions.

Proven Benefits of RPM for Hypertension

Lower Blood Pressure Readings

- Studies show that RPM programs can reduce systolic blood pressure (SBP) by 10-15 mmHg and diastolic blood pressure (DBP) by 5-7 mmHg within a few months.
- Patients using RPM are more likely to achieve their target blood pressure compared to standard care.

Increased Patient Compliance & Engagement

- Patients in RPM programs check their blood pressure more frequently, leading to better long-term control.
- Real-time data allows for personalized treatment adjustments and early intervention before complications arise.

Fewer Emergency Visits & Lower Costs

- Continuous monitoring has been linked to reduced hospitalizations and ER visits, helping prevent costly complications.
- RPM can lead to thousands of dollars in annual savings per patient by reducing unnecessary healthcare utilization.
