

PeriWatch Command Center

Remote patient monitoring across your health system or with contracted hospitals

PeriGen solutions can be used to help achieve a telehealth initiative at your facility.

PeriGen can provide remote perinatal telemonitoring to enable nurses at larger urban/suburban hospitals to monitor mothers and babies across multiple facilities from a central monitoring location. Patterned after a cardiac telemetry unit, a central monitoring station provides oversight within your hospital, across the healthcare organization and/or contracted hospitals. These remote clinical services help to bridge the gap in care for large health systems, community hospitals, and rural hospitals.

Monitor From Central Location

Ability to monitor multiple sites with a consultative role from a central monitoring location.

Promote Patient Safety

Synchronize and expedite care of monitored perinatal patients with continuous observation by experienced staff.

Surveillance At All Stages

Continuous monitoring at all stages of perinatal care. Transmission of patient assessment including continuous electronic fetal monitoring, vital signs, and additional metrics.

Cost Sharing

Related costs are shared between command center location and monitored site.

Contact your Client Executive or Info@PeriGen.com to learn how we can help improve patient safety at your health system.
