

Repair Due Soon

Medical devices are critical tools for delivering life-saving patient care.

To ensure they continue to function properly, regular maintenance is needed.

Quickly locating and retrieving assets requiring PM from among a facility's vast asset inventory can be like looking for a needle in a haystack.

Using a handheld reader with a dynamically adjustable read distance, set a farther read distance to broadly detect an asset's location, then shorten the read distance to zero in on your targeted asset.

PREVENTATIVE MAINTENANCE

With Pycube's Preventative Maintenance solution, save time and worry with automatically generated lists of assets due for PM.

Benefits

- Live dashboard provides real-time information about your tagged assets' last known locations available on demand to quickly locate for PM
- Conduct targeted searches to locate a specific device among a mixed group
- Software allows you to track progress on asset collection and update maintenance schedules

Stop searching for the needle in the haystack —
eliminate the haystack, with Pycube.
