Over 1 million Americans experience major preventable complications annually.

Patients are suffering from preventable pain, extended hospital stays, and increased financial burden - all as a result of inadequate preparation.

The Cost of Complications

Preventable infections cost over \$40 billion a year. This includes:

+**78%** employee absenteeism
+**114%** longer hospital stays

+**\$9k** productivity loss / patient
+**\$37k** in treatment costs / patient

Here's how we help.

Hospital rankings

Selecting the wrong hospital **doubles your length of stay**. We use millions of data points to match users with the optimal facility for their individual medical profile.

Custom action plan

Equip your team with personalized guidance, enabling them to take proactive measures for enhanced safety and infection prevention, avoiding 70% of complications.

Surgeon matching

Patients spend over 19 days choosing a surgeon. Streamline their search with our recommendation engine to find the right match faster and stress-free, cutting complications by up to **98% with the most experienced surgeon**.

We rate providers and hospitals across 200+ quality metrics to find the optimal match from their history and procedure.

The Value of Personalized Care

When you think of surgery tips, you probably imagine generic, long-winded pamphlets that seem to require a medical degree to interpret. With the **average discharge instructions lasting 1 minute** in the hospital, you won't be getting much more support there either.

With **End to End Health**, we focus on your unique needs at every step.

Our service is built around a detailed risk factor profile we build from your history that shapes every step of your journey, from the **hospital you select to your daily recovery action items**.

Why Hospital Choice Matters

Though often overlooked, your hospital selection significantly impacts your likelihood of a pain-free recovery. Consider the differences in results for hospitals in the same county:

2 times

Average hospital stay

12 times

Overall mortality rate

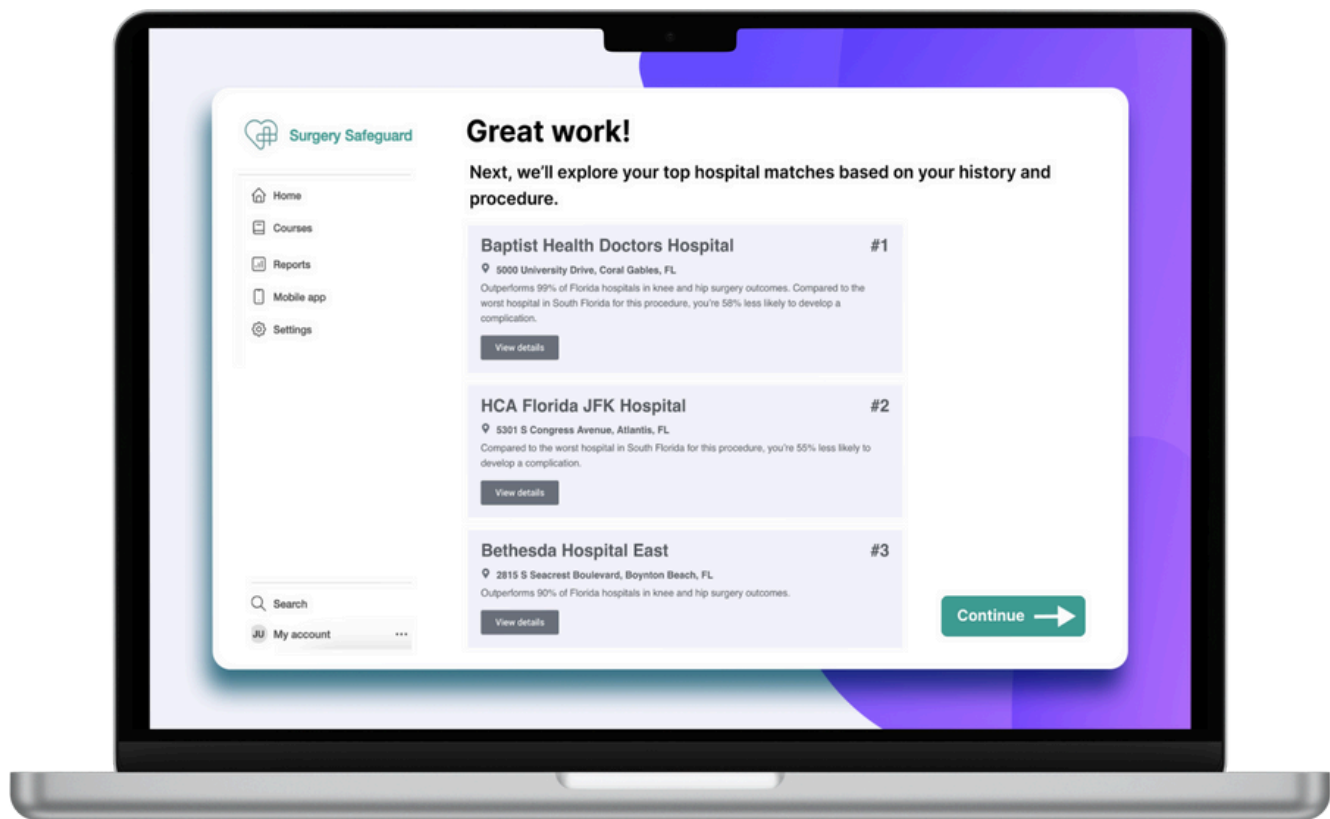

31 times

Bloodstream infection rate

Your likelihood of **mortality increases by up to 1,200%** with a lower quality hospital in the same county.

We help your employees identify the right hospital for their needs and procedure, based on millions of outcomes from similar patients.

Imagine you're going to have your thyroid removed. Who would you prefer?

A) General Surgeon

Performs gallbladder removals, kyphoplasties, and several thyroidectomies per year.

B) ENT Surgeon

Performs over 100 thyroidectomies per year and has practiced for the past thirty-five years.

Naturally, you'd select the ENT. **But 81% of people unknowingly select the less experienced MD.**

Your likelihood of complications decreases by up to 98% with the more experienced ENT surgeon.

The research is clear - the higher the frequency of performing a complex surgery, the higher the success rate. We use this proven relationship to match employees with the optimal provider, minimizing avoidable complications through our **patent-pending process**.

Get access to the quality metrics you need to make an informed choice.

Our companion app supports your team from prep to recovery. Get the steps to prevent **70% of complications.**

Pre-surgical assessments

Get screening suggestions, prophylactics, and simple habits to avoid infections based on your risk factors.

Medication management

25% of errors are attributed to incorrect medication records or dosage. We help flag problems to discuss with the medical team.

Custom discharge support

After a hospital stay, you're likely overtired. We give you customized questions ahead of your stay.

Custom learning plan

Receive a unique action plan based on your risk profile. With over 200 activities available, all plans are comprehensive.

Accessible task list

Your action items are always on your home screen, keeping them top-of-mind.

Timely reminders

We order your modules by priority to keep things manageable.
